Exp. Name: Write a python script to display a S.No: 1

simple message.

Aim:

Write a python script to display a simple message.

Source Code:

sample_messag.py

print("Welcome to Python Programming Lab")

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** Welcome to Python Programming Lab

Exp. Name: Write a python script to perform basic S.No: 2 arithmetic operations on two values which are accepted from the user

Aim:

Writeapythonscripttoperformbasicarithmeticoperationsontwovalueswhichare accepted from the user Source Code:

```
operation.py
```

```
num1 = int(input('Enter a number1: '))
num2 = int(input('Enter a number2: '))
print("Addition of {} and {} is {}".format(num1,num2,eval('num1+num2')))
print("Subtraction of {} from {} is {}".format(num1,num2,eval('num1-num2')))
print("Multiplication of {} with {} is {}".format(num1,num2,eval('num1*num2')))
print("Division of {} by {} is {}".format(num1,num2,eval('num1/num2')))
print("Modulus of {} by {} is {}".format(num1,num2,eval('num1%num2')))
print("Floor Division of {} by {} is {}".format(num1,num2,eval('num1//num2')))
print("Exponent of {} to the power of {} is {}".format(num1,num2,eval('num1**num2')))
```

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** Enter a number1: Enter a number2: Addition of 8 and 4 is 12 Subtraction of 8 from 4 is 4 Multiplication of 8 with 4 is 32 Division of 8 by 4 is 2.0 Modulus of 8 by 4 is 0 Floor Division of 8 by 4 is 2 Exponent of 8 to the power of 4 is 4096

Exp. Name: Write a python script to calculate the factorial of a given number.

Aim:

Write a python script to calculate the factorial of a given number.

Source Code:

S.No: 3

```
factorial.py
def factorial(n):
       if n < 0:
                return 0
        elif n == 0 or n == 1:
                return 1
       else:
                fact = 1
                while(n>1):
                        fact *=n
                        n -= 1
                return fact
num = int(input("Enter a number :"))
print("Factorial of",num,"is",factorial(num))
```

Test Case - 1		
User Output		
Enter a number :		
5		
Factorial of 5 is 120		

Exp. Name: Write a python script to calculate sum of individual digits of a given number

Aim:

Write a python script to calculate sum of individual digits of a given number

Source Code:

S.No: 4

```
sumofindi.py
print("Sum of individual difits of a given number ")
num = int(input("Enter a number :"))
s = 0
num1 = num
while(num>1):
        d = num\%10
        s = s + d
        num = int(num/10)
print("The sum of {} is : {}".format(num1,s))
```

Test Case - 1	
User Output	
Sum of individual difits of a given number	
Enter a number :	
5234	
The sum of 5234 is : 14	

Exp. Name: Write a python script to display the prime number series up to the given N Value

Aim:

Write a python script to display the prime number series up to the given N Value

Source Code:

S.No: 5

```
prime_interval.py
start = int(input("Enter Starting value :"))
end = int(input("Enter Ending value :"))
for i in range(start,end+1):
       if i>1:
               for j in range(2,i):
                        if(i % j==0):
                                break
                else:
                                print(i)
```

Test Case - 1	
User Output	
Enter Starting value :	
2	
Enter Ending value :	
11	
2	
3	
5	
7	
11	

Exp. Name: Write a python script to find the largest S.No: 6 number among three numbers and display them in ascending order using if-else construct.

Aim:

Write a python script to find the largest number among three numbers and display them in ascending order using if-else construct.

Source Code:

```
large_ascending.py
print("To find largest among three numbers and display in ascending order")
num1 = int(input("Enter first number :"))
num2 = int(input("Enter Second number :"))
num3 = int(input("Enter Third number :"))
if num1 > num3:

elif num2 > num3:
       print("Largest number is :",num2)
else:
       print("Largest number is :",num3)
li = [num1, num2, num3]
li.sort()
print("Ascending Order is :",li)
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
To find largest among three numbers and display in ascending order
Enter first number :
10
Enter Second number :
20
Enter Third number :
30
Largest number is : 30
Ascending Order is : [10, 20, 30]
```

Test Case - 2 **User Output** To find largest among three numbers and display in ascending order Enter first number : 12 Enter Second number : 25 Enter Third number : 98

Ascending Order is : [12, 25, 98]

Largest number is : 98

Exp. Name: Write a python script to create a simple text file, write the contents into the created file and display the same on to the console screen.

Aim:

S.No: 7

Write a python script to create a simple text file, write the contents into the created file and display the same on to the console screen.

Source Code:

```
text_display.py
filename = input("Enter file name: ")
file1 = open(filename, 'r')
for line in file1:
                print(line)
file1.close()
file1 = open(filename, "a")
file1.write("Stay Home Stay Safe")
file1 = open(filename, 'r')
for line in file1:
                print(line)
file1.close()
```

MyFile.txt

Hello Every one!

MyFile2.txt

content of file after reading -

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** Enter file name: MyFile.txt Hello Every one! Hello Every one! Stay Home Stay Safe

Exp. Name: Write a python script to remove all the occurrences of a given character from a text file; copy the resultant text into another text file. Find the total occurrences of the eliminated characters and display the count along with the contents of the text file on to the console.

Date: 2024-03-04

Aim:

S.No: 8

Write a python script to remove all the occurrences of a given character from a text file; copy the resultant text into another text file. Find the total occurrences of the eliminated characters and display the count along with the contents of the text file on to the console.

Source Code:

```
occurrences.py
f1 = open("textfile.txt", "w")
f1.write("Write a python script to remove all the occurrences of a given character from a
text file; copy the resultant text into another text file. Find the total occurrences of the
eliminated characters and display the count along with the contents of the text file on to
the console.")
f1.close()
f2 = open("textfile.txt",'r')
print("**** TEXT IN A FILE ****")
print(f2.read())
f2.seek(0)
f3 = open("textfile2.txt", 'w')
char = input("Enter a character to count its occurrence:")
count = 0
rc = -1
while(rc):
       rc = f2.read(1)
       if rc == char:
                count +=1
       else:
               f3.write(rc)
f2.close()
f3.close()
print("Total count of " + char + " is ", count)
f4 = open("textfile2.txt",'r')
print("**** Text after eliminating "+char+" ****")
print(f4.read())
f4.close()
```

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** **** TEXT IN A FILE ****

Write a python script to remove all the occurrences of a given character from a text file; copy the resultant text into another text file. Find the total occurrences of the eliminated characters and display the count along with the contents of the text file on to the console.

Enter a character to count its occurrence:

Total count of e is

**** Text after eliminating e ****

Writ a python script to rmov all th occurrncs of a givn charactr from a txt fil; copy th rsultant txt into anothr txt fil. Find th total occurrncs of th liminatd charactrs and display th count along with th contnts of th txt fil on to th consol.

Test Case - 2

User Output

**** TEXT IN A FILE ****

Write a python script to remove all the occurrences of a given character from a text file; copy the resultant text into another text file. Find the total occurrences of the eliminated characters and display the count along with the contents of the text file on to the console.

Enter a character to count its occurrence:

Total count of i is 12

**** Text after eliminating i ****

Wrte a python scrpt to remove all the occurrences of a gven character from a text fle; copy the resultant text nto another text fle. Fnd the total occurrences of the elmnated characters and dsplay the count along wth the contents of the text fle on to the console.

Exp. Name: Write a python script to display Fibonacci sequence of numbers using while loop S.No: 9 constructs.

Aim:

Write a python script to display Fibonacci sequence of numbers using while loop constructs.

Source Code:

```
fibonacci_while.py
print("Fibonacci Sequence")
first = 0
second = 1
num = int(input("Enter length of series :"))
print("Fibonacci Sequence using while loop")
print("{}\n{}".format(first,second))

Date: 2024-04-23

Aim:

S.No: 12

Write a python script to demonstrate string methods.

- 01.Capitaize the first character
- 02.Casefold the characters
- 03.Center the string
- 04.count the character 'a' in string
- 05.Encode to a binary
- 06.Check where the string ends with *
- 07. Check the position of the substring 'find' in the given input.
- 08. Starting index of 'c' character in a string
- 09.Check the string is numeric
- 10.Check the string is alphabet
- 11.Check the string is lower
- 12.split the string

Source Code:

```
string_methods.py
a=input("Enter String: ")
print("python script to demonstrate string methods")
print("To Capitaize first character ",a.capitalize())
print("To casefold the characters",a.casefold())
print("To center the string",a.center(75,"*"))
print("To count the character 'a' in string",a.count('a'))
print("To encode to a binary",a.encode())
print("To check where the string ends with *",a.endswith("*"))
print("To find the substring starting position",a.find("t",-1))
print("To get the starting index of 'c' character in a string",a.index('c'))
print("To check the string is numeric",a.isalnum())
print("To check the string is alphabet",a.isalpha())
print("To check the string is lower",a.islower())
print("To split the string",a.split())
```

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** Enter String: codetantra

python script to demonstrate string methods
To Capitaize first character Codetantra
To casefold the characters codetantra
To center the string ************************************
To count the character 'a' in string 2
To encode to a binary b'codetantra'
To check where the string ends with * False
To find the substring starting position -1
To get the starting index of 'c' character in a string 0
To check the string is numeric True
To check the string is alphabet True
To check the string is lower True
To split the string ['codetantra']

Exp. Name: Write a program to find a given element, if the element to be found and its next S.No: 16 element are the same then return True as output, otherwise return False.

Date: 2024-05-08

Aim:

Write a program to find the given element in a list. If the element to be found and its next element are the same, then return True, otherwise return False.

Sample Input and Output - 1:

```
list1: 32,36,36,5
num: 36
True
```

Sample Input and Output - 2:

```
list1: 33,34,35
num: 34
False
```

Source Code:

```
List15.py
data = input("data: ")
my_list = data.split(",")
size = len(my_list)
for i in range(size):
       my_list[i] = int(my_list[i])
print("list:", my_list)
find = int(input("num: "))
for i in range(0, len(my_list) - 1):
        if my_list[i] == find:
                if my_list[i + 1] == find:
                        result = "True"
                        break
                else:
                        result = "False"
print(result)
```

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** data: 10,20,30 list: [10, 20, 30] num: 20

Test Case - 2 User Output	
10,20,20,30	
list: [10, 20, 20, 30]	
num:	
20	
True	7

Exp. Name: Write a python script to arrange the given list of elements in ascending or descending order.

Aim:

Write a python script to arrange the given list of elements in ascending or descending order.

Source Code:

S.No: 17

```
order.py
num = list(map(int,input("Enter list of numbers: ").split()))
num.sort()
print (num)
num.sort(reverse=True)
print (num)
```

```
Test Case - 1
User Output
Enter list of numbers:
258963147
[1, 2, 3, 4, 5, 7, 8, 96]
[96, 8, 7, 5, 4, 3, 2, 1]
```

Test Case - 2		
User Output		
Enter list of numbers:		
25 63 47 85 41 69		
[25, 41, 47, 63, 69, 85]		
[85, 69, 63, 47, 41, 25]		

Exp. Name: Write a Python program to find gcd of Date: 2024-05-08 two numbers

Aim:

Write a Python program to find the GCD of two numbers.

Source Code:

S.No: 18

```
gcdOfTwoNumbers.py
import math
def gcd_two(a, b):
       print("The gcd of two numbers is:", math.gcd(a, b))
a = int(input("Enter first number: "))
b = int(input("Enter second number: "))
gcd_two(a, b)
```

```
Test Case - 1
User Output
Enter first number:
10
Enter second number:
20
The gcd of two numbers is: 10
```

Test Case - 2	
User Output	
Enter first number:	
78	
Enter second number:	
9	
The gcd of two numbers is: 3	

Exp. Name: Write a python script to find GCD of S.No: 19 two numbers using recursive

Aim:

Write a python script to find GCD of two numbers using recursive.

Source Code:

```
gcd.py
def gcd(a, b):
       if(b==0):
                return a
       else:
                return gcd(b,a%b)
a=int(input("Enter first number:"))
b=int(input("Enter second number:"))
GCD=gcd(a,b)
print("GCD is: ",GCD)
```

Test Case - 1	
User Output	
Enter first number:	
12	
Enter second number:	
6	
GCD is: 6	

Exp. Name: Write a Python program to convert Date: 2024-05-08 temperatures to and from Celsius, Fahrenheit.

Aim:

Write a Python program to convert temperatures to and from Celsius, Fahrenheit.

Source Code:

S.No: 20

```
temperature.py
```

```
a = input("Enter the temperature in celsius or fahrenheit: ")
b = int(a[:-1])
c = a[-1]
if (c == "C" or c == "c"):
       result = int(round((9 * b) / 5 + 32))
       d = "Fahrenheit"
elif (c == "F" or c == "f"):
       result = int(round((b - 32) * 5 / 9))
        d = 'Celsius'
else:
       print("Enter the proper convention")
        quit()
print("The temperature in",d,"is",result,"degrees")
```

Execution Results - All test cases have succeeded!

Test Case - 1

User Output

Enter the temperature in celsius or fahrenheit:

215c

The temperature in Fahrenheit is 419 degrees

Test Case - 2

User Output

Enter the temperature in celsius or fahrenheit:

105F

The temperature in Celsius is 41 degrees
